The moderating role of corporate reputation and employee-company identification on the work-related outcomes of job insecurity resulting from workforce localization policies

Abstract:

Although previous studies have examined the impact of job insecurity, there remains a need to understand specific issues related to job insecurity that results from government workforce localization policies. This study addresses this gap by examining employees' work-related outcomes: employee engagement, job burnout, and intentions to quit, recognizing the interplay of employees' identification with an organization and perceived corporate reputation in the context of Saudi Arabia's localization policies. The study uses social identification theory to explain how employees' perception of corporate reputation and their identification with a company shape their work attitudes in the presence of job-insecurity. Partial least square - path modeling (PLS-PM) and PROCESS tool is used to test hypotheses from data collected from 135 expatriate migrant employees working in different organizations in Saudi Arabia. Findings show that job insecurity has a significant effect of reducing the engagement of immigrant employees and leads to increased employee burnout and intentions to quit jobs. The results of moderation analysis show that favorable corporate reputation reduces the negative impact of job insecurity on employee's burnout and intentions to quit, whereas high level of identification with company may also reduce employee burnout, even during job insecurity. Although immigrant employees do not seek to leave a reputable organization due to localization policies, they still experience stress, become disengaged, and so are less productive. As a result, businesses should leverage their reputation towards governmental policies of localization, by advocating expatriate employees' contributions towards organizations and economy.

Keywords: Job insecurity, employee engagement, job burnout, corporate reputation, employee-company identification, workforce localization.

1. Introduction

In recent years, and especially following the economic downturn in 2008, there have been renewed government policies directed at reducing immigration and localizing job markets (Ruhs and Anderson, 2010). This is noted in diverse locations, for example in the US, with the Trump administration developing policy to reduce immigrant labor (Alexander, 2017; Payan, 2016), in the EU and particularly the UK, with the conservative government promising reduced immigration, with implied positive impact on employment for UK workers (BBC, 2017; O'Rourke, 2016), in Singapore, with policy tensions over the need for immigration and local anti-immigrant sentiment (Tan, 2017), and particularly, in Arab countries including; Saudi Arabia, Bahrain, Kuwait, Oman, United Arab Emirates, and Qatar, all of which have pre-existing and ongoing workforce localization policies to deal with unemployment issues in the local population (Hasan, 2014; Al-Asfour and Khan, 2014).

There are, however, significant implications for businesses that rely on an immigrant labor force in such a policy environment. This is specifically the case in Saudi Arabia - our context - that has established quotas for 'Saudization', the employment of local workers, (Ramady, 2013; Al-Asfour and Khan, 2014). Saudization has resulted in dubious practices such as 'Ghost Workers', local employees who are paid, but not required to work (Al-Asfour and Khan, 2014) as organizations attempt to deal with the policy, whilst managing their labor needs, and avoiding extra payments to the government. Nevertheless, the result is that expatriate workers are experiencing job insecurity, with related negative effects on their wellbeing, work

behaviors and intention to quit, which in turn risks productivity and so also economic growth (Cheng and Chan, 2008; Niesen et al., 2018; Piccoli and De Witte, 2015; Piccoli et al. 2017; and Sverke, Hellgren and Näswall, 2002). Businesses that are subject to localization policies remain reliant on immigrant labor that is able to undertake work without the negative effects that come with job insecurity (and indeed may prefer these workers, see Ramady, 2005; 2013) and it is important that they therefore understand how best to manage immigrant employees who are effected by such policy. Indeed, both businesses and governments can benefit from an understanding of how to maintain immigrant employee productivity during any transition to localization.

One defense against the negative consequences of government policy directed towards workforce localization should be the reputation of the organization itself, and related employee organizational identification. Specifically, corporate reputation is recognized as an important asset that can protect corporations (Ali et al., 2015; Foroudi et al., 2016; Tischer & Hildebrandt, 2014; Wang et al., 2016; Tucker & Melewar, 2005), with positive corporate reputation shaping favorable stakeholder behaviors (Ali et al., 2015; Gaultier-Gaillard & Louisot, 2006; Tischer & Hildebrandt, 2014) and with resulting positive employee organizational identification (Ashforth & Mael, 1989; DeConinck, 2011). Put simply, those organizations with a better reputation, and stronger employee identification may be better placed to avoid negative employee behaviors associated with policy-induced job insecurity.

This study examines the association between job insecurity and the potential work-related outcomes of localization, captured by employee engagement, burnout, and intention to quit, with corporate reputation and employee identification as moderating variables. The context is Saudi Arabia, a country with one of the most developed and sustained policies of workforce

localization (Hasan, 2014; Al-Asfour and Khan, 2014). The contributions of the paper are manifold: (i) it examines the work-related outcomes of job insecurity in the environment of localization of job market policies, (ii) it offers an understanding of the moderating roles of corporate reputation and employee-company identification amid job insecurity, and its effect on work-related outcomes, and (iii); it offers practical implications to allow corporate managers to increase positive employee outcomes and to avoid negative employee outcomes amid conditions of job insecurity.

2. Theoretical background and hypotheses

Localization policies have work-related implications (Hasan, 2014). Indeed, increased job insecurity for immigrant employees is a specific intention of the policy, with possibilities of either immigrant employee disengagement, an increased intention to quit, or at best a desire to work harder to maintain their vulnerable position regardless of the impact on their wellbeing. We might therefore also consider the risk of burnout under these increasing work-related pressures (Bosman et al., 2005; and Manzano-García and Ayala, 2017). Taken together then, engagement, burnout, and intention to quit represent work-related outcomes of localization policies that may be measured in this study.

Amid such a situation it is challenging for organizations to keep their employees motivated, yet organizations with a strong reputation may find this easier to achieve. This research therefore further proposes that corporate reputation and related employee-company identification may yield positive work behavior, even amid policy-induced job insecurity, noting that where both are high, negative outcomes (burnout and intention to quit) should be less evident, and positive outcomes (engagement) should be more present.

Although several studies have examined the impact of job insecurity on employees' work related outcomes (for instance Bosman, 2005, Gosh, 2017; Niesen, et al., 2018; and Piccoli et al., 2017), the key constructs that reduce negative employee outcomes, and/or increase positive employee related outcomes amid policy-induced job insecurity have not been identified. The current study therefore offers an important contribution by examining the impact of job insecurity caused by localization policies on expatriate (immigrant) workers. Specifically, it examines how both corporate reputation and social identity related to an organization (Tajfel and Turner, 1979) moderate the relationship between job insecurity - as a psychological contract breach - and expatriate employees' work-related outcomes. In doing so important implications for business managers are identified. To ensure productivity managers need to understanding and address factors that impact on employee engagement, help them to avoid burnout, and reduce their intentions to leave, even when there are government policies that increase job insecurity.

2.1. Job insecurity and work-related outcomes

Since 1970s there has been substantial research on job insecurity and its influence on employee behaviors (Ashford et al., 1989; Cobb & Kasl, 1977). Job insecurity refers to a "sense of powerlessness to maintain desired continuity in a threatened job situation" (Greenhalgh and Rosenblatt (1984, p. 438). Individuals experience job insecurity as threatening, and it is one of the most important work-related stressors (De Witte, 1999). Even though it may sometimes result in stress induced pro-organizational performance by employees, this is also detrimental for organizations in long-term (Gosh, 2017) as job insecurity can result in a deterioration of somatic or mental health (Ashford et al., 1989; Cobb & Kasl, 1977; Hartley et al., 1991). It is also related to negative behaviors such as disengagement, increased burnout, and intention to quit (Ashford et al., 1989; Cuyper et al., 2008; Hallier & Lyon, 1996; Meyer & Parfyonova, 2010), as well as a

decline in job satisfaction, organizational commitment and employee attachment (Furaker & Berglund, 2014; Hallier & Lyon, 1996; Hartley et al., 1991). Overall, job insecurity can also produce a decline in employee innovation (Neison, 2018), and lower employee performance (Piccoli, 2017). The result of all of this is that it can lead to increased costs for organizations, for example through absence and lowered productivity (Laszlo et al., 2010).

2.2. Job insecurity and employee engagement

Improving employee engagement activities has become popular among consulting firms. Schaufeli & Bakker, (2003) define employee engagement as: “a positive, fulfilling, work-related state of mind that is characterized by three interrelated dimensions, namely vigor, dedication, and absorption”. Employee engagement is about being psychologically present when performing a role, and represents both emotional and intellectual commitment, and a discretionary effort towards an organization (Richman, 2006). Numerous studies have also examined the influence of job insecurity on employee engagement, for instance, Cheng et al., (2005); De Witte, (1999); and Presti and Nonnis (2012) noted negative effects of job insecurity on employee engagement. Similarly, Greasley et al. (2005); and Stander and Rothmann (2010) hold that employees who perceive high levels of job insecurity work with less vigor and dedication, and hence display lower levels of engagement with their organization. We might therefore assume that expatriate employees who perceive high job insecurity as a result of by localization policy will lose interest and dedication towards the organization they work for. This paper therefore, hypothesizes that job insecurity negatively affects employee engagement.

H1: Job insecurity is negatively related to employee engagement.

2.3. Job insecurity and burnout

Burnout is defined as a syndrome related to feeling emotionally overwhelmed by work resulting in exhaustion, depersonalization (an impassive and impersonal response towards others) and reduced personal accomplishment (a feeling of having less competence and achievement in one's work). Burnout is a response to emotional or interpersonal stressors at work (Maslach & Jackson, 1981, 1996; Mustafa et al., 2007), and leads to less engagement with one's job (Maslach et al., 2001). There is already evidence in the literature that job insecurity impacts employee burnout. For example, Tilakdharee et al. (2010) found a positive association between job insecurity and an employee burnout inventory. Similarly, Aybas et al., (2015), Chirumbolo and Areni (2005), De Witte, (2005), and McLean, (2006) hold that employees who perceive high level of job insecurity also experience high burnout. Immigrants may already experience considerable stress and mental exhaustion in their jobs as they often work longer hours and have to accomplish challenging tasks in country where they are also attempting to establish roots. Localization policies can be a significant additional stressor as it impacts on their future work prospects. Hence, the second hypothesis is related to job insecurity and employees' perceptions of burnout.

H2: Job insecurity is positively related to employee burnout.

2.4. Job insecurity and intentions to quit

Intention to quit is an individual subjective evaluation with regards to whether one will leave the organization in the near future and is the most immediate predictor of such behavior (Ismail, 2015). In this paper, we use intentions to quit as operationalized by Colarelli (1984), where employees have intentions to search for new job opportunities soon. Previous studies have acknowledged that job insecurity increases intentions to quit, for instance; Bernston et al., (2010); Dekker & Schaufelli, (1995); Ismail, (2015) argue that job insecurity leads to negative evaluations of organizations by employees and consequently they start searching for other

appropriate work. In a recent study, Jimenez et al. (2017) found that job insecurity caused by economic crises (where an organization has to reduce the workforce), led to high stress among employees and intentions to quit to find other suitable work. However, little is known about how job insecurity resulting from workforce localizations policies affects intentions to quit. This study therefore proposes that in the context of workforce localization:

H3: Job insecurity is positively related to employees' intentions to quit.

2.5. The moderating role of corporate reputation

We might recognize that some organizations may be better placed than others to mitigate negative work related outcomes caused by job insecurity resulting from localization policies. It has already been acknowledged that corporate reputation provides a sustainable competitive advantage to organizations (Ali, 2011; Capozzi, 2005, Zyglidopoulos, 2005) based on the knowledge, beliefs and impression of the organization held by various stakeholders (Ali & Zia, 2011; Helm & Tolsdorf, 2013; Musteen et al., 2010; Rhee & Haunschild, 2006; Su et al., 2016). Fombrun (1996) defines corporate reputation as “set of collectively held beliefs about a company's ability and willingness to satisfy various stakeholders”. Once established, a favorable reputation also safeguards an organisation, even in a crisis (Coombs & Holladay, 2001). Indeed, such is the perceived value of corporate reputation that it has become a key focus for corporate activity as it protects against a wide variety of external circumstances (Coombs & Holladay, 2001; Highhouse et al., 2009; Zyglidopoulos, 2005). The current study uses *employees'* assessment of corporate reputation and considers the work behaviors that results from such assessment. Based on social-identity theory, employees experience a sense of belonging by defining themselves as someone who works for an organization of high repute (Ashforth & Mael, 1989). Individuals use selective perceptions to assess information to avoid or reduce

dissonance (Festinger, 1953; Jain & Maheswaran, 2000), so that employees with positive attitudes towards a company may disregard later negative information (Helm & Tolsdorf 2013). Research has also previously examined the influence of corporate reputation in increasing employees positive work behaviors such as job satisfaction, commitment, and work engagement, (Helm, 2011, and Shirin & Kleyn, 2017). Similarly, corporate reputation has been found to reduce employee feelings of burnout and intention to quit (Alniacik et al., 2011, Beheshtifar and Allahyary, 2013). However, in an important report (Deloitte, 2016) proposed that corporate reputation is especially important for corporations in times of crises. Similarly, Coombs & Holladay (2001), Dean, (2004), Jain & Maheswaran, (2000), and Watson (2007) also find that corporate reputation is important for organizational survival in times of crises, and in our case this means the negative effects of job insecurity caused by external government policy. As an emerging field, scholars have used different corporate reputation constructs to explain its importance for various stakeholders (Pires,& Trez, 2018), yet although a number of studies are available that examine the moderating role of corporate reputation in the context of customer behavior (Qasim et al., 2017; and Sridhar and Mehta, 2018) and other stakeholders (Ali et al., 2015), there is little literature available that specifically examines the moderating role of corporate reputation on the relationship between job insecurity and employees work-related outcomes.

Despite the indirect associations available in the literature, there remains insufficient theoretical evidence for the moderating role of corporate reputation on the relationship between job insecurity and employee outcomes. Following these arguments, we therefore propose that favorable corporate reputation reduces the negative effects of job insecurity, whereas unfavorable corporate reputation adversely influences employee engagement.

H4a: The negative effect of job insecurity on employee engagement is moderated by perceived corporate reputation. The effect is stronger when corporate reputation is favorable and weaker when corporate reputation is unfavorable.

H4b: The positive effect of job insecurity on employee burnout is moderated by perceived corporate reputation. The effect is stronger when corporate reputation is favorable and weaker when corporate reputation is unfavorable.

H4c: The positive effect of job insecurity on employee intentions to quit is moderated by perceived corporate reputation. The effect is stronger when corporate reputation is favorable and weaker when corporate reputation is unfavorable.

2.6. The moderating role of employee-company identification

According to social-identity theory, individuals also attach emotional significance to the groups to which they belong (Tajfel, 1978), with the likelihood of favorable behaviors (Ashforth et al., 2008). These groups include the workplace and so employee-company identification has been defined as: “that part of an individual self-concept which derives from his/her knowledge of his membership of a social group (or groups) together with the value and emotional significance attached to that membership” (Tajfel, 1978, p.63). Employee-company identification postulates that employees value their membership of an organization when they see a good fit between their individual values and organizational values. The concept has been used to explain its effects in developing pride in organizational membership and other employee-related behaviors. Identification with organization is therefore important to employees as they feel that they personally embody organizational values and beliefs (Ashforth & Mael, 1989; van Knippenberg & Sleebos, 2006), experiencing high levels of meaning and goal congruence between themselves

and the organization (Corley et al., 2006). There is already some limited research that examines the positive influence of employees-company identification in increasing positive work behaviors (job satisfaction, commitment, organizational citizenship, work engagement) (Meyer, et al., 2004; Riketta, 2005; and Zafar & Ali, 2016). Other studies have examined the mediating role of employee company identification in developing positive employee work outcomes (Abdullah, 2017; El-Kassar et al. 2017; and Wang et al., 2017). Guarana, (2010) in particular examined the moderating role of employee organizational identification in increasing employee engagement and reducing burnout. Since an intention to quit a job is also a negative work behavior, it may be assumed that higher levels of employee-company identification will also reduce employees' intentions to quit amid job insecurity. Thus, employees who identify with an organization may experience fewer negative effects from job insecurity, and so also less burnout and a lower intention to quit. In addition, increased job insecurity may not decrease employee engagement if they perceive high level of identification with their organization. Based on these arguments, we propose the following hypotheses.

H5a: The negative effect of job insecurity on employee engagement is moderated by perceived employee-company identification. The effect is stronger when employee-company identification is favorable and weaker when employee-company identification is unfavorable.

H5b: The negative effect of job insecurity on employee burnout is moderated by perceived employee-company identification. The effect is stronger when employee-company identification is favorable and weaker when employee-company identification is unfavorable.

H5c: The negative effect of job insecurity on employee intentions to quit is moderated by perceived employee-company identification. The effect is stronger when employee-company identification is favorable and weaker when employee-company identification is unfavorable.

2.7. The research model

We bring these hypotheses together in a conceptual model, Figure 1, that also incorporates control variables including; designation, education and experience that may explain employees' behaviors (employee engagement, employee burnout and intentions to quit). Job insecurity is the independent variable with employee engagement, burnout, and intentions to quit as dependent variables and corporate reputation, and employee company identification as moderating variables. The model explains how corporate reputation and employee company identification affects the work behavior of expatriate employees (the sample) amid job insecurity resulting from localization of the job market in Saudi Arabia. Although there is existing research that examines the association between job insecurity and employee work related outcomes, the conceptual model in this study proposes that organizations can leverage a favorable reputation (as perceived by employees), and employees' identification with the organization, to *reduce* negative work related outcomes amid insecure job market conditions resulting from external factors, in this case government localization policies. The study offers an incremental contribution to the body of knowledge on this topic by explaining the moderating roles of corporate reputation and employee identification, in the context of the localization of the Saudi labor market.

Insert Figure 1 here

3. Method

3.1 Context

The context under investigation is Saudi Arabia, a country that is experiencing ongoing economic issues due to a decline in oil prices following the financial crisis of 2008, and that is representative of countries where the government has adopted localization policies that have impacted on the workforce. Despite the crisis, Saudi Arabia is a young, rich nation, facing a paradox of high wealth, but also high unemployment among local citizens (Torofdar, 2011), with the job market heavily dependent upon foreign workers (Al-Dosary & Rahman, 2009). In order to provide employment to local citizens, the government has therefore implemented 'Guided Localization' with the aim of replacing expatriate employees with local Saudis (Saudi Gazette, 2016, 2017). This has caused unrest among expatriate employees who remain important for the Saudi economy (Aljead, 2014), and indeed businesses have also found the adjustment difficult. Although our focus is Saudi Arabia, this context is transferable to a wider range of countries that are similarly addressing ongoing economic and employment issues through localization policies, for example, the US, UK and Singapore. Like Saudi Arabia, these are also multi-cultural countries dealing with the tensions of globalization following the financial crisis of 2008.

What limited research exists on the effects of Saudization on the job market in Saudi Arabia focuses on employment opportunities for Saudi citizens, and on the impact on economic growth (Torofdar, 2011), rather than the effects of localization on workplace outcomes for immigrant employees and the organizations they work for. The current research addresses this gap. With the insecurity and associated disillusionment in immigrant employees, there is a greater need for businesses to retain appropriate and necessary overseas workers and maintain, or

increase their productivity, with the possibility that those businesses with a good reputation, and identification with these employees, are better placed to adjust to localization.

3.2 Sample and data

The unit of analysis in this study is the immigrant employees working in Saudi Arabia. Data was collected through personally administered and online survey questionnaires including 135 valid and complete answers from immigrant employees in different organizations in Saudi Arabia (see Appendix I, which includes demographic profile, education, and designation in the organization, monthly income, and tenure). Participation in the data collection process was voluntary and the confidentiality of the data was assured to respondents. The selection of participants was based on the professional connections of the research team.

Using convenience sampling, 500 expatriates were approached, and invited to participate in the survey, which spanned one month (April 10, 2017 to May 10, 2017). Most respondents who participated were from Egypt (17.8%), India (12.6%), Jordan (10.4%), Sudan (9.6%), and Yemen (8.1%). The sample as a whole reflects the diversity and proportion of different overseas workers in Saudi Arabia. The sample included 67% males and 33% females. About 43.7% participants had a bachelor's degree and 33.3% had master degrees. Twenty three percent of respondents had 2-5 years of experience, 57% had 6-10 years, and 11.9% had 11-15 years. The smaller female representation also reflects the more limited opportunities for female workers in Saudi Arabia. Appendix 1 shows the demographic characteristics of the sample.

3.3 Instruments and measures

This survey questionnaire was administered in English as a language known to all participants. Previous studies have effectively utilized English surveys in non-native English-speaking countries (Ali et al., 2017; Bouckenooghe et al., 2017; Khan et al., 2015; Naseer et al., 2016). The use of English also provides an opportunity for the comparison of findings with those of previous research that employed English surveys (i.e., primarily conducted in another context; Naseer et al., 2016).

From the review of the literature, various measures have been employed for the constructs including; job insecurity, corporate reputation, employee company identification, and employee engagement, burnout, and intentions to quit. The job insecurity instrument is taken from De Witte (2000) containing 4 items and used by Vander Elst et al. (2014) (i.e., “chances are I will soon lose my job”). All measures are answered on a 5-point Likert ranging from 1 (strongly disagree) to 5 (strongly disagree).

Corporate reputation is measured through an 8-items scale from Feldman & Vasquez-Parraga (2013) (i.e., “this company contributes actively and voluntarily to the social improvement, economic and the environmental of society” or “this company stands behind its products and services with good price and good quality that meet consumer”). A 6-items scale from Mael & Ashforth (1992) measures organizational identification (i.e., “when someone criticizes this organization, it feels like a personal insult”).

Employee engagement is measured through a scale developed by Saks (2006), with 6 items each for job engagement and organizational engagement (i.e., “I really throw myself into my job”, or “being a member of this organization is very captivating”). Job burnout is measured using Maslach & Jackson’s (1981) scale followed by Choi et al. (2012). The study uses two

dimensions of job burnout: emotional exhaustion (i.e., “I feel emotionally drained from customer service work”), and depersonalization (i.e., “I worry about being callous toward people”), with 4 items each. The final employee behavior - intention to quit - is measured through 3 items scale by Colarelli’s (1984), (i.e., “I frequently think of quitting my job”).

Although previous studies have analyzed the influence of the demographics complexity of employees - for instance education, designation, and experience - in different ways (Ageeva et al., 2018; Foroudi et al., 2016), they have not been able to explain their effects on employees work behavior. Hence, in addition to the key hypothesis-testing variables, this study included controls for education, designation, and experience to eliminate whatever effects they might have on employees work behavior. These three variables are measured with nominal scales described in Appendix I.

3.4 Common method variance

The data collected for this study is self-reported and cross-sectional as the data for both independent and dependent variables were collected from the same source and at same time. This might mean that the common method variance (CMV) may inflate the strength of observed structural relationships among the constructs in the model. To address the issue of CMV, this study employs Lindell and Whitney’s (2001) marker variable analysis. This involves introducing an additional latent variable referred as a “marker variable” that is theoretical unrelated to the main constructs of the study. This study uses “corporate hypocrisy” as a marker variable that is measured by six items adopted from Wagner, Lutz, and Weitz (2009). The data for the marker variable was collected at the same time and in the same manner as the focal variables, and analysis also confirms the reliability and validity of the marker variable (Cronbach’s alpha = 0.76, composite reliability = 0.84, AVE = 0.65). Table 2 shows that none of the correlations of

the marker variable is significant with any other variable, suggesting that the data did not suffer from CMV in this study.

4. Analysis and results

4.1 Statistical method

This study employed a partial least squares path modeling (PLS-PM) technique (Henseler, Ringle, & Sarstedt, 2015; Sarstedt, Ringle, & Hair, 2017; Richter, Cepeda, Roldán, & Ringle, 2015). Despite a surprising level of enmity towards PLS-PM (Rönkkö & Evermann, 2013; Rönkkö, McIntosh, & Antonakis, 2015; Rönkkö, McIntosh, Antonakis, & Edwards, 2016), PLS-PM has become popular among scholars for its ability to construct theory (Henseler et al., 2014b; Petter, 2018; Rigdon, 2016; Roldán & Sánchez-Franco, 2012; Sarstedt, Hair, Ringle, Thiele, & Gudergan, 2016). The use of PLS-PM in this study was appropriate because: (1) PLS-PM is a suitable approach for prediction oriented research (e.g., predictions of employee behavior); (2) PLS-PM is an appropriate procedure for estimating and testing complex structural relationships; (3) PLS-PM is a convenient tool for handling hierarchical latent variable models (e.g., employee engagement and job burnout); (4) PLS-PM provides latent variables scores which could be used in the subsequent analysis of a two-stage approach for modeling the multidimensionality and moderating analysis; (5) although the sample size ($n = 135$) may seem small, according to statistical power analysis using the G*Power 3.1.9.2 program (Faul et al., 2007), the model used only required a sample of 45 to detect R^2 values of around 0.25, therefore, the statistical power of the sample of 135 samples was acceptable, assuming a significance level of 5%, a statistical power of 80%, 6 constructs in this study, 37 items, and an effect size of 0.15 (Hair et al., 2017), and finally; (6) the PLS-PM technique provides some of the latest statistical tools such as heterotrait–monotrait (HTMT) ratio for discriminant validity, effect size for relative contribution

of each predictor, confidence intervals in testing hypothesis, and graphs for moderation analysis. This study used SmartPLS 3 software (Ringle, Wende, Becker, 2015) for the PLS-PM analysis, and a freely available computational tool for SPSS called PROCESS macro (Hayes, 2017) for the conditional moderating analysis.

4.2 Measurement model assessment

To assess the measurement model of all reflective first-order constructs, this study focused on the psychometric properties of reliability, validity and dimensionality of each construct as discussed in the following sub-sections. All results of reflective first-order constructs are reported in Step 1 in Table 1.

4.2.1 Reliability

The individual reliability of the items was assessed by examining the standardized factor loadings. As a popular rule of thumb Fornell and Larcker (1981) recommend factor loading of ≥ 0.707 , while factor loading ≥ 0.50 could be considered practically significant for exploratory research (Nunnally, 1978). This study follows Roldán and Sánchez-Franco (2012) recommendation to use two-tailed p -values for confirming the significance of factor loadings. The standardized factor loadings of all first order constructs are shown in Step I in Table 1. All factor loadings are found to be above the minimum threshold (i.e., ≥ 0.50), and are significant at $p < 0.001$ level (two tailed), indicating convergent validity at the item level. Factor loadings < 0.50 were dropped during path analysis. The construct reliability was assessed by examining the Cronbach's alpha and composite reliability and should be ≥ 0.70 (Nunnally, 1978). Step I in Table 1 shows the scores of Cronbach's alpha and composite reliability are > 0.70 , indicating construct reliability.

Insert Table 1 here

4.2.2 *Convergent validity*

The convergent validity was evaluated by examining the average variance extracted (AVE) and should be ≥ 0.50 (Fornell and Larcker, 1981). This suggests that ≥ 50 percent of the item variance should be accounted for. Step I in Table 1 shows that all the constructs have an adequate convergent validity as the values of AVE are > 0.50 .

4.2.3 *Discriminant validity*

This study assesses the discriminant validity using Fornell-Larcker's criterion and the heterotrait-monotrait ratio of correlations (HTMT). Following Fornell-Larcker's (1981) criterion for each pair of constructs, the AVE square root of each construct should be higher than the absolute value of their correlation. Table 2 shows both the AVE square root on the diagonal line for the constructs and the absolute value of their correlation. Secondly, discriminant validity was tested using HTMT. The acceptable values for HTMT should be < 0.85 HTMT < 0.90 . The values above the diagonal in Table 2 shows the HTMT values which are < 0.85 , suggesting that discriminant validity was present in this study.

Insert Table 2 here

4.2.4 *Modeling second-order constructs*

Employee engagement and job burnout were operationalized as second-order constructs. Employee engagement was operationalized as a second-order construct, made up of two first-order dimensions: job engagement and organization engagement. As in Table 1 and Fig 1, the two first-order dimensions reflect the higher-order construct. Similarly, this study measured job

burnout as a second-order construct consisting of two first-order dimensions: depersonalization and emotional exhaustion as shown in Table 1 and Fig 1. A two-stage approach was employed to evaluate the second-order constructs. In first stage, the reflective items were used to obtain the latent variable scores for all the first-order reflective constructs, which, in the second stage, served as manifest variables in the measurement model of second-order constructs (Becker, Klien and Wetzels, 2012; Hair et al., 2017). The criteria for assessing the first-order constructs of the measurement model such as reliability, convergent validity and discriminant validity also apply to second-order constructs. As Step II in Table 1 reported the results of reflective second-order constructs, suggesting that the second-order constructs met all the minimum requirements of acceptability (Ali, Ali, Leal-Rodríguez, & Albort-Morant, 2018a; Ali, Ali, Badghish, and Baazeem, 2018b; Ali, Musawir, and Ali, 2018c).

4.3 Structural model assessment

This study followed the recommendations in Hair et al. (2017) to evaluate the structural model and testing hypothesis. Before analyzing results from the structural relationship, the collinearity test was conducted by examining the variance inflation factor (VIF) value. This study assessed all possible sets of (predictors) constructs for collinearity. The values of VIF are <3.3 or <5 , suggesting that the structural model has minimal collinearity (Hair et al., 2017).

The predictability in the structural model is analyzed by examining the coefficient of determination or R^2 value for three endogenous variables. R^2 may vary depending on the research field. The values of 0.67, 0.33, and 0.19 as measures of R^2 are suggested to be substantial, moderate, and weak respectively (Chin, 2010). The $R^2_{(\text{employee engagement})} = 0.43$, $R^2_{(\text{employee burnout})} = 0.37$, and $R^2_{(\text{intention to quit})} = 0.52$ suggesting that R^2 values were moderate and acceptable. The

model's predictive relevance in terms of out-of-sample prediction is analyzed by examining the Q^2 values via blindfolding approach. A Q^2 value >0 suggests predictive relevance. The Q^2 values for all endogenous variables >0 , suggesting that the model is predictive (Hair et al., 2012).

4.4 Model fit

A goodness of fit measure is an index for model validation and obtained by calculating the standardized root-mean square residual (SRMR), (Henseler et al., 2015). Since SRMR is an absolute measure of fit, a value of zero indicates perfect fit, but a value <0.08 is generally considered a good fit (Hu & Bentler, 1998). This study revealed a SRMR $0.07 < 0.08$, suggesting that the path model fitted with the empirical data (Hair et al., 2017; Henseler et al., 2015).

4.5 Control variables

As anticipated, few of the control variables shown significantly different effects across the work-related outcomes. The results of control variables suggested that employee experience was positively related to employment engagement ($\beta = 0.02^*$, $p < 0.05$). Employee designation was positively related to employee burnout ($\beta = 0.06^*$, $p < 0.05$), while employee experience was negatively related employee burnout ($\beta = -0.04^*$, $p < 0.05$). These results are consistent with prior research in this area (Ageeva et al., 2018; Foroudi et al., 2016).

4.6 Hypotheses testing

The sizes and significance levels of the path coefficients represent the derived hypotheses. Following Hair et al. (2017), the significance levels of the path coefficients are obtained using a PLS algorithm, a resampling bootstrapping procedure (with 5000 bootstrap samples and 135

bootstrap cases). The path coefficients, standard errors, significance level, *t*-values as well as the accompanying bootstrap confidence intervals at 95% are shown in Table 3. An examination of path coefficients and levels of significance suggest that all the direct, and three of the moderating effects are significant. The findings indicate that the direct effect of job insecurity on employee engagement ($\beta = 0.13^*$, $p < 0.05$), employee burnout ($\beta = 0.50^{**}$, $p < 0.01$), and intention to quit ($\beta = 0.57^{***}$, $p < 0.001$) is positive and significant. The moderating results are discussed in next section.

Insert Table 3 here

4.7 Conditional moderating effects

To examine the conditional moderating effects of exogenous variables on endogenous variables at different values of moderating variables, this study followed the procedure in Ali et al., (2018a), complement the results of SmartPLS 3 while employing an inferential test using the PROCESS macro. Using latent variables scores obtained from SmartPLS 3 as an input (Ali et al., 2018a), this analysis produced estimates and bias-correlated 95% bootstrap confidence internals for indirect effect with different values of corporate reputation and employee-company identification as moderating constructs.

Results obtained from SmartPLS 3 in Table 3 shows that H4a was not supported as the moderating effect of corporate reputation on the relationship between job insecurity and employee engagement ($\beta = -0.02^{n.s}$; $p > 0.05$) is insignificant. There was also no support for H5a as the employee-company identification has no moderating effect on the relationship between job insecurity and employee engagement ($\beta = 0.04^{n.s}$; $p > 0.05$). In addition, there was no support for

H5c as the moderating effect of employee-company identification on the relationship between job insecurity and intentions to quit ($\beta = 0.03^{n.s.}$; $p > 0.05$) is insignificant.

The moderating effect of corporate reputation on the relationship between job insecurity and employee burnout ($\beta = 0.19^{**}$; $p < 0.01$) and on the relationship between job insecurity and intention to quit ($\beta = 0.26^{**}$; $p < 0.01$) were significant, in support of H4b and H4c respectively. Also, the moderating effect of employee-company identification on the relationship between job insecurity and employee burnout ($\beta = 0.15^{*}$; $p < 0.05$) was significant as shown in Table 4.

Next, this study examined corporate reputation at three levels to determine whether the relationship between job insecurity and employee burnout varies at different levels of corporate reputation as shown in Table 4(A). These three levels were as follows: the mean ($M = 3.54$; $S.D = 0.90$), which was equivalent to the average levels of corporate reputation among the sample; the mean minus one standard deviation ($-1 S.D$; i.e., 2.54), which was equivalent to low levels of corporate reputation; and the mean plus one standard deviation ($+1 S.D$; i.e., 4.54), which was equivalent to high levels of corporate reputation. Consistent with H4b, Table 4(A) shows that when corporate reputation was low ($-1 S.D$), the conditional effect of job insecurity on employee burnout was positive and significant but weak ($\beta = 0.35$, boot $S.E = 0.11$). However, when corporate reputation was high ($+1 S.D$), the conditional effect was both positive and significant ($\beta = 0.74$, boot $S.E = 0.12$).

These findings supported H4b such that the positive effect of job insecurity on employee burnout was moderated by perceived corporate reputation. Fig 2 shows the moderating effect's slope in greater detail. The effect was stronger when corporate reputation was favorable and weaker when corporate reputation was unfavorable. The upper blue line, which represents a low level of corporate reputation, has a flatter slope while the lower green line, which represents a

high level of corporate reputation, has a steeper slope. As a rule of thumb and an approximation, the slope of the low level of corporate reputation was the simple effect (i.e., 0.50) minus the interaction effect (0.19), while the slope of high level of corporate reputation was the simple effect (i.e., 0.50) plus the interaction effect (0.19). Hence the simple slope plot supported the previous discussion of the positive interaction term. Higher levels of corporate reputation produced a stronger relationship between job insecurity and employee burnout, while lower levels of corporate reputation led to a weaker relationship between job insecurity and employee burnout. So the moderating effect of corporate reputation on the relationship between job insecurity and employee burnout was generally positive, but increased with increasing levels of corporate reputation. Applying the same procedures, the findings in Table 4(B) were consistent with H4c, which suggested that the positive effect of job insecurity on employee intentions to quit was moderated by perceived corporate reputation. Here the effect was also stronger when corporate reputation was favorable and weaker when corporate reputation was unfavorable (Fig. 3). This suggested that the relationship between job insecurity and intentions to quit became stronger with higher levels of corporate reputation. For the low levels of corporate reputation, the slope was much flatter, as shown in Fig 3.

Hence, with low levels of corporate reputation, the relationship between job insecurity and intentions to quit became weaker. Similarly, the findings in Table 4(C) were consistent with H5b, suggesting that the effect of job insecurity on employee burnout was moderated by perceived employee-company identification. The effect was also stronger when employee-company identification was favorable and weaker when employee-company identification was unfavorable (Fig. 4). That is, the relationship between job insecurity and employee burnout became stronger with high level of perceived employee-company identification and for low

levels of perceived employee-company identification the slope was much flatter and the relationship between job insecurity and employee burnout becomes weaker.

Insert Table 4 here

5. Discussion and conclusion

This study examined the influence of job insecurity on the work-related outcomes of engagement, burnout, and intention to quit in the presence of corporate reputation and employee company identification, amid a government policy of workforce localization. Previous work has highlighted that although there are some apparent organizational benefits to job insecurity, such as employee striving to maintain their post, the negative effects are stronger (Sverke, Hellgren and Näswall, 2002; Cheng and Chan, 2008; Staufienbiel and König, 2010). To our knowledge job insecurity has not been tested in the context of government localization policies. The results confirm a significant effect of job insecurity in reducing engagement by immigrant employees (H1), such that the workforce localization policy risks the productivity of these economically important workers. Policy-induced job insecurity also leads to increased employee burnout (H2) and intentions to quit (H3), revealing a stressed and discontent immigrant workforce. Experience is the only control variable that shows a positive and significant effect on employee engagement. This implies that experienced workers tend to be more engaged with the organization, which is also consistent with previous studies (Ageeva et al., 2018). Nevertheless, overall the negative impact of policy induced job insecurity is significant.

Coombs and Holladay (2001), Dean, (2004), and Jain and Maheswaran, (2000) have all argued that favorable corporate reputation *should* reduce any negative effects caused by job insecurity, and indeed this study confirms that corporate reputation has a significant moderating effect between job insecurity (H4a), burnout (H4b) and intentions to quit (H4c), with a stronger

effect for higher levels of corporate reputation. Identification with an organization has also been positively associated with a loyal workforce (Ashforth & Mael, 1989; van Knippenberg & Sleebos, 2006), and an alignment of employees to the organizational goals (Corley et al., 2006). However, in this study there was insignificant moderation between job insecurity and employee engagement. Even with a good organizational reputation amongst immigrant employees, government localization policies still result in a less engaged workforce. However, when corporate reputation is higher the relationship between job insecurity and burnout is also higher. We theorize that this is because in a highly reputable company, the productivity of employees also tends to be high (for example see Stuebs and Sun, 2010) and therefore the environment is already highly competitive, prior to any impact from localization policies. Those employees who feel insecure with their jobs because of policy may then attempt to work even harder and are thereby more likely to burnout. Previous research shows that favorable corporate reputation protects the organization in a crisis, or from adverse external circumstances (Coombs & Holladay, 2001; Zyglidopoulos, 2005), however, an implication of our findings is that even a strong positive corporate reputation cannot make up for a government policy that is directly aimed at immigrant workers when it comes to their engagement, although it still may protect employees from burnout, and the organization from losing key immigrant workers from resignation.

Employee-company identification has an insignificant moderating role between job insecurity and employee engagement (H5a) and burnout (H5b), but a significant moderating role between job insecurity and intentions to quit (H5c) among immigrant employees. Again, developing strong employee identification can protect a corporation from losing key immigrant staff prematurely in a period of localization, but does not protect against disengagement, and

does not reduce burnout. The implications are that although employees may not seek to leave an organization when all other jobs are also vulnerable to localization policy, they do experience stress that can cause them to become disengaged and so potentially less productive.

Overall then, corporate reputation and employee identification does not fully protect the organization from the negative consequences of workforce localization policies. The presence of a powerful new government policy therefore suggests that there are limits to the benefits that previous research has attributed to corporate reputation (see Coombs & Holladay, 2001; Dean, 2004; Jain & Maheswaran, 2000). Such an observation may be transferable to other government policy that is capable of ‘overriding’ the careful work corporations do to develop their corporate reputation and nurture positive employee identification, especially in the six countries of the Arabian Peninsula - Bahrain, Kuwait, Oman, Qatar, the Kingdom of Saudi Arabia, and the United Arab Emirates (Hasan, 2014), but also in other countries where government policy is reacting to political demands to reduce immigrant workforces.

Although the focus here is immigrant employees as stakeholders, we might also consider the implication of such policy change on how an organization communicates with other stakeholders. The limitations of corporate reputation in maintaining an engaged workforce highlights the need for an effective government lobby, and communication about workforce needs with other external stakeholders to mitigate the impact on immigrant employment on the basis of the potential loss of productivity and related economic impact.

Continued workforce localization may be inevitable in Saudi Arabia (and indeed elsewhere), but the uncertainty and job insecurity that result has serious implications for organizations. Disengagement, burnout and intentions to quit can reduce productivity and harm organizational performance during any transition to a local workforce. Although this may be

accepted as a consequence of the policy by government, to ensure a transition that minimizes negative economic effects, corporate lobbying might attempt to influence policy so that it supports corporations and their immigrant employees through localization transitions programs, in particular supporting employee engagement. Where government policy is a response to an electorate, or local population that favors the localization of the workforce, this may also involve communicating the value of immigrant labor more generally in society and here again corporate reputation may prove valuable.

By conveying their concern to government that expatriate employees' knowledge and expertise are important for organizational performance and productivity, organization may also further develop a favorable corporate reputation in immigrant employees. In light of possible economy harm, ideally corporations might ask the government to limit any localization policy in order to retain sufficient number of expatriate workers to maintain organizational performance. Corporations might also convince the government to clearly communicate labor market policies regarding the localization of labor markets as any uncertainty in labor market policies towards localization may be harmful even to the expatriate employees who are not likely to lose their job, as they won't know for sure if their job is secure or not. Once the expatriate employees feel that their organization is fulfilling its responsibility to protect their jobs by communicating their importance to the government and other external stakeholders, the employees' perception towards corporate reputation and identification with company should increase, which will in-turn reduce possible negative employees outcomes at work place.

At the organizational level there is also a need for specific and directed intervention to address this situation by reducing ambiguity and communicating an ongoing commitment to important immigrant employees, so ensuring psychological job security such that they work with

greater peace of mind and so contribute to achieving organizational goals. Managers can increase employees identification with the company by paying serious attention to improved internal communication with employees (Smidts et al. 2001), providing adequate information to expatriate employees about the governmental and organizational policies related to their job security and the actions taken by the organization to protect their jobs. Indeed where both reputation and identification cannot fully protect immigrant employees, direct support, for example transfers to other offices, visa sponsorship, or nationalization support programs are possible options.

The model developed in this research can be applied to other countries that are undertaking localization, and/or anti-immigration policies in the job market where organizations are known to be reliant on the labor force that is subject to the insecurity that results, for example in the US, in the UK as a result of Brexit, and in Singapore. It would be interesting to also understand how such foreign employees in these developed countries perceive job insecurity under such external policies, and if there is any significant change in the work behaviors of respondents with gender, education, income level, designation, or personality traits.

Fig. 3. Moderating effect of corporate reputation on the relationship between job insecurity and intention to quit (see online version for colors).

Fig. 4. Moderating effect of employee-company identification on the relationship between job insecurity and employee burnout (see online version for colors).

Table 1: Measurement model results.

Constructs	Code	Items	S.L	S.E	t-value a, b	α	C.R	AVE c	VIF
Step I: Results of the assessment of measurement model for first order constructs									
Corporate reputation						0.94	0.95	0.69	2.59
	CR1	This company contributes actively and voluntarily to the social improvement, economic and the environmental of society.	0.83	0.04	22.35				
	CR2	This company stands behind its products and services with good price and good quality that meet consumer.	0.85	0.02	34.67				
	CR3	This company treats customers courteously, communicates with them and takes care of their safety and health.	0.75	0.04	17.58				
	CR4	This company generates respect, admiration esteem and confidence among people.	0.87	0.02	42.85				
	CR5	This company is recognized, has excellent leadership, is innovative, and seeks constant overcoming.	0.82	0.03	26.80				
	CR6	This company looks like a good company to work, already be by its infrastructure such	0.84	0.03	33.57				

		as its working environment, benefits and good treats with its employees.							
		This company is a company with values that obeys the laws, transparent and respects							
	CR7	people and the environment.	0.83	0.03	30.22				
		This company supports good causes that							
	CR8	benefits society and environment.	0.85	0.02	38.19				
Employee-company identification									2.48
						0.84	0.89	0.58	
		When someone criticizes my company, it							
	ECI1	feels like a personal insult.	0.84	0.03	28.01				
		I am very interested in what others think							
	ECI2	about my company.	0.37	0.16	2.32				
		When I talk about this company, I usually							
	ECI3	say “we” rather than “they.”	0.83	0.04	21.54				
	ECI4	This company’s success is my success.	0.80	0.04	20.45				
		When someone praises this company, it							
	ECI5	feels like a personal compliment.	0.82	0.04	21.24				
		If a story in the media criticized this							
	ECI6	company, I would feel embarrassed.	0.79	0.05	14.77				
Job Insecurity						0.82	0.90	0.74	2.22
	J-In1	Chances are I will soon lose my job.	0.87	0.03	32.49				

	J-In2*	I am sure I can keep my job.	--	--	--				
	J-In3	I feel insecure about the future of my job.	0.79	0.05	14.58				
		I think I might lose my job in the near							
	J-In4	future.	0.91	0.01	62.00				
Job engagement			0.70	0.09	7.26	0.72	0.82	0.54	2.03
	EE-JE1	I really “throw” myself into my job.	0.71	0.11	6.76				
		Sometimes I am so into my job that I lose							
	EE-JE2	track of time.	0.72	0.09	7.83				
		This job is all consuming; I am totally into							
	EE-JE3	it.	0.80	0.07	11.40				
		My mind often wanders and I think of other							
	EE-JE4*	things when doing my job.							
	EE-JE5	I am highly engaged in this job.	0.70	0.10	7.32				
Organization engagement									2.50
						0.81	0.87	0.57	
		Being a member of this organization is very							
	EE-OE1	captivating.	0.74	0.06	12.71				
		One of the most exciting things for me is							
		getting involved with things happening in							
	EE-OE2	this organization.	0.70	0.09	8.17				
		I am really not into the “goings-on” in this							
	EE-OE3*	organization.							

	EE-OE4	Being a member of this organization make me come “alive.”	0.76	0.05	13.80				
	EE-OE-5	Being a member of this organization is exhilarating for me.	0.75	0.05	13.90				
	EE-OE-6	I am highly engaged in this organization.	0.82	0.03	29.56				
Emotional Exhaustion									1.95
						0.82	0.88	0.64	
	JB-EE1	I feel emotionally drained from customer service work.	0.67	0.11	6.18				
	JB-EE2	I feel used up by the end of the workday.	0.77	0.07	10.50				
	JB-EE3	I feel fatigued when I get up in the morning.	0.86	0.03	24.66				
	JB-EE4	I feel burned out from customer service work.	0.88	0.02	35.57				
Depersonalization						0.78	0.86	0.60	2.00
	JB-Dep1	I have become more callous (heartless) toward customers.	0.66	0.11	5.92				
	JB-Dep2	I feel that I treat customers as if they were impersonal “objects”.	0.79	0.06	13.57				
	JB-Dep3	I worry about being callous (heartless) toward people.	0.77	0.06	13.14				
	JB-Dep4	I have become callous (heartless) toward	0.87	0.03	33.12				

people.

Intent to quit Job			0.75	0.03	22.10	0.68	0.83	0.62	1.70
	ITQ1	I frequently think of quitting my job.	0.84	0.04	20.85				
		I am planning to search for a new job during							
	ITQ2	the next 12 months.	0.89	0.02	49.76				
		If I have my own way, I will be working for							
	ITQ3	this organization one year from now.	0.61	0.10	5.88				
Control variables									
	Designation	Employee's designation	1.00	0.00	0.00	1.00	1.00	1.00	1.00
	Education	Employee's education	1.00	0.00	0.00	1.00	1.00	1.00	1.00
	Experience	Employee's experience	1.00	0.00	0.00	1.00	1.00	1.00	1.00
Step II: Results of the assessment of measurement model after generating second order construct									
Employee engagement									1.00
						0.78	0.90	0.91	
		Job engagement	0.88	0.03	26.91				
		Organization engagement	0.93	0.01	70.33				
Job burnout						0.76	0.89	0.90	1.33
		Depersonalization	0.91	0.02	44.85				
		Emotional Exhaustion	0.88	0.03	29.32				

Note: * The item is problematic and so removed from final analysis. S.L = Standard loadings; S.E = Standard error; ^a Test-statistics are obtained by 5000 Bootstrap runs; ^b Absolute t-values > 1.96 are two-tailed significant at 5 percent; α = Cronbach's Alpha; C.R = Composite reliability; AVE = Average variance extracted; ^c Percentage of variance of item explained by the latent variable; VIF = Variance inflation factor shows collinearity.

Table 2: Mean, standard deviations, correlations and discriminant validity results.

	Mean	S.D	1	2	3	4	5	6	7	8	9	10
1. Corporate reputation	3.54	0.90	0.83	0.71	0.24	0.63	0.25	0.46	0.03	0.08	0.15	0.10
2. Employee-company identification	3.64	1.34	0.71**	0.76	0.30	0.67	0.30	0.39	0.04	0.12	0.02	0.09
3. Job insecurity			-									
	3.03	0.82	0.24**	-0.30**	0.86	0.13	0.59	0.58	0.25	0.35	0.09	0.15
4. Employee engagement	3.37	0.54	0.57**	0.60**	-0.12	0.90	0.20	0.37	0.07	0.18	0.11	0.13
5. Job burnout	3.26	0.65	-0.21*	-0.26**	0.53**	-0.06	0.89	0.57	0.09	0.23	0.10	0.11
6. Intent to quit job			-									
	3.01	0.94	0.46**	-0.39**	0.58**	-0.34**	0.50**	0.79	0.04	0.05	0.09	0.11
7. Employee's designation	3.04	1.28	-0.03	-0.04	-0.25**	0.06	-0.09	0.04	1.00 [†]	0.39	0.29	0.06
8. Employee's education	2.31	0.89	0.08	0.12	-0.35**	0.17	-0.22	-0.05	0.39**	1.00 [†]	0.22	0.09
9. Employee's experience	2.84	0.81	0.15	0.02	-0.09	0.10	-0.08	-0.09	0.29**	0.22**	1.00 [†]	0.04
10. Corporate hypocrisy (Marker variable)	3.14	0.65	0.04	-0.06	-0.16	-0.10	-0.09	-0.08	0.01	0.03	0.03	0.80

Note: * $p < 0.05$; ** $p < 0.01$; [†] The AVE value is not meaningful criterion for single-item measures. S.D = Standard deviation; Diagonal and italicized elements are the square roots of the AVE (average variance extracted).

Below the diagonal elements are the correlations between the constructs values.

Above the diagonal elements are the HTMT values.

Table 3: Structural model results.

Structural path	Path coefficient	Boot S.E	t-value (bootstrap)	95% Confidence interval	Conclusion

SRMR composite model = 0.07					
$R^2_{\text{Employee engagement}} = 0.43$; $Q^2_{\text{Employee engagement}} = 0.28$					

$R^2_{\text{Employee burnout}} = 0.37$; $Q^2_{\text{Employee burnout}} = 0.24$
 $R^2_{\text{Intentions to quit}} = 0.52$; $Q^2_{\text{Intentions to quit}} = 0.45$

Note: $|t| \geq 1.65$ at p 0.05 level; ** $|t| \geq 2.33$ at p 0.01 level; *** $|t| \geq 3.09$ at p 0.001 level; n.s = Not significant (based on $t(4999)$, one-tailed test).

R^2 = Determination coefficients; Q^2 = Predictive relevance of endogenous (omission distance=7).

Threshold for R^2 value ≥ 0.25 (weak); ≥ 0.50 (moderate); ≥ 0.75 (substantial).

Threshold for Q^2 value > 0 indicate predictive relevance.

Table 4: Conditional process analysis.

	Path coefficient	Boot S.E	t-value (bootstrap)	95% Confidence interval
<i>(A) Conditional effect of job insecurity on employee burnout at the values of corporate reputation</i>				
Low; M - 1.0037 S.D (2.54)	0.35	0.11	3.10	(0.13, 0.57)
Moderate; M (3.54)	0.54	0.09	6.25	(0.37, 0.71)
High; M + 1.0037 S.D (4.54)	0.74	0.12	6.28	(0.50, 0.97)
<i>(B) Conditional effect of job insecurity on intentions to quit at the values of corporate reputation</i>				
Low; M - 1.0037 S.D (2.54)	0.52	0.09	5.91	(0.34, 0.69)
Moderate; M (3.54)	0.59	0.08	7.40	(0.43, 0.74)
High; M + 1.0037 S.D (4.54)	0.66	0.10	6.50	(0.46, 0.86)
<i>(C) Conditional effect of job insecurity on employee burnout at the values of employee-company identification</i>				
Low; M - 1.0037 S.D (2.64)	0.32	0.15	2.12	(0.02, 0.62)
Moderate; M (3.64)	0.47	0.10	4.69	(0.27, 0.67)
High; M + 1.0037 S.D (4.64)	0.62	0.12	5.22	(0.39, 0.86)

Note: Values for corporate reputation/employee-company identification (moderators) are the mean and plus/minus one standard deviation (S.D) from mean.

Appendix I: Demographic characteristics of the sample

Information about respondents			Information about sampling firms		
Measurement	No.	%	Measurement	No.	%
<i>(a) Education</i>			<i>(a) Origin of company</i>		
High school	23	17.0	Saudi	82	60.7
Bachelors	59	43.7	Non-Saudi	53	39.3
Master	45	33.3	<i>(b) Number of employees</i>		
PhD	4	3.0	Less than 100 employees	47	34.8
Professional	4	3.0	101 - 500	50	37.0
<i>(b) Experience</i>			More than 500	38	28.1
< 1 year	7	5.2			
2-5 years	31	23.0			
6-10 years	77	57.0			
11-15 years	16	11.9			
> 15 years	4	3.0			
<i>(c) Designation</i>					
Support staff	24	17.8			
Clerical	11	8.1			
Officer	61	45.2			
Junior manager	14	10.4			
Middle level manager	25	18.5			
<i>(d) Income (Saudi Riyals per month)</i>					
< 5000 SAR	24	17.8			
5000 - 9,999	41	30.4			
10,000-14,999	40	29.6			
15000 - 19,999	16	11.9			
> 20,000 SAR	14	10.4			
<i>(e) Gender</i>					
Male	90	66.7			
Female	45	33.3
